

Same $f_1 = 0.802$ Hz, $f_2 = 0.996$ Hz in both rows; only the starting condition differs (linear model, $A = 8$ mm)

(a) ideal instantaneous release: $x_1(0) = A$, $x_2(0) = 0$

(b) hold-and-release: spring 2 has already moved to $x_2(0) = A\gamma/(k + \gamma)$
